                                                                                                                                                                                                                                                             Gaps
               ADP-ribosylating toxins, pertussis holotoxtin (PT), E. coli heat labile toxin (LT), and verotoxin-1 (VT). The structural information obtd. from these comparisons was used to identify sites which contribute to PT's biological activity. By modifying these sites the claimed PT mutants of the invention were produced, they can be used in the development of vaccines against Bordetella
AAR72540-R72545 are structurally equivalent B-subunits from three

One method comprises identifying at least 1 site in a PT that interacts with a molecule that is capable of forming a complex with the holotoxin and which molecule is an effector molecule which is an adenine nucleotide and which site contributes to toxicity, cell binding or enzymatic activity of PT. The functional interacting site(s) are identified by analysing the three dimensional structure of crystalline PT, determined by X-ray crystallogaphy. The identified interacting site(s) are modified to alter toxicity, cell binding or enzyme activity of the PT. The methods can be used to alter a biological activity such as toxicity, enzymatic activity, mitogenicity, cell binding and adjuvanticity of the PT. The three-dimensional structure of PT have functional and/or structural resemblance to other bacterial
holotoxin, functional (aa) which affect biological properties of the pertussis holotoxin can be identified. This can be used to predict (aa) which contribute to the toxicity of the holotoxin to produce immunoprotective, genetically-detoxified analogues of pertussis holotoxin. The present sequence represents an ADP-ribosylating toxin B-subunit peptide used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modifications to e.g. enzymatic activity, mitogenicity and cell binding of pertussin holotoxin - by identifying interaction sites of a molecule with crystalline toxin and modifying the identified site
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pertussis holotoxin; PT; modified; effector; toxicity; cell binding; enzyme; ADP-ribosylation; toxin; crystalline; X-ray crystallography; structural analysis; interacting site; mitogenicity; adjuvanticity;

The crystalline form of the pertussis holotoxin can be used in a comparison with other proteins which have functional resemblance to pertussis holotoxin with the aim of modifying other proteins. Identifying the unknown sites of toxicity by comparison with the three dimensional structure of pertussis holotoxin provides a technique for detoxification of toxins to produce useful immunogenic but non-toxic analogues. It can also be used as a primary standard to measure the quantity, purity or efficacy of less pure compositions containing pertussis toxin. AMY68340 to AMY68385 represent peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Armstrong GD;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a method for producing a pertussis toxin (also designated lymphocytosis-promoting factor, histamine-sensitising factor and islet activating protein) with a modified biological activity, involving analysing the crystal structure of the protein to identify active sites which can then be modified. This may lead to an alteration in the toxicity, cell binding or enzyme activity of the toxin. This can be used in the production of immunoprotective analogues of pertussis toxin is the cause of whooping cough following infection
                                                                                                                                                                                                                                                                                         Pertussis toxin; crystal structure; whooping cough; biological activity; lymphocytosis-promoting factor; histamine-sensitising factor; islet-activating protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modifying pertussis holotoxin to produce detoxified PT analogs, comprising analyzing crystalline structure of toxin, to identify sites of toxicity, cell binding or enzyme activity of PT and modifying identified site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Klein MH, Armstrong GD;

The present invention relates to recombinant exotoxin protein variants, which comprise an exotoxin mucosal cell binding motif and a nucleic acid affinity domain. The present sequence is one such protein variant. In the present invention the heat-labile enterotoxin (LT) of Escherichia coli was used as an exotoxin. LT is a member of the ADP-ribosylating exotoxin (DARE) family. The protein variants are useful for selectively delivering nucleic acid to mucosal cells, for inducing an immune response when the nucleic acid encodes an antigen to which the immune response is desired, for selectively delivering a gene to a mucosal cell, and for achieving expression of a protein in a subject, by administering a composition
Novel exotoxin protein variant useful as protein carrier for facilitating gene delivery, comprises a mucosal cell binding motif of an exotoxin and a nucleic acid affinity domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The present invention relates to recombinant exotoxin protein variants, which comprise an exotoxin mucosal cell binding motif and a nucleic acid affinity domain. The present sequence is one such protein variant. In the present invention the heat-lable enterotoxin (LT) of Escherichia coli was used as an exotoxin. LT is a member of the ADP-ribosylating exotoxin (DARE) family. The protein variants are useful for selectively delivering nucleic acid to mucosal cells, for inducing an immune response when the nucleic acid encodes an antigen to which the immune response is desired, for selectively delivering a gene to a mucosal cell, and for achieving expression of a protein variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to recombinant exotoxin protein variants, which comprise an exotoxin mucosal cell binding motif and a nucleic acid affinity domain. The present sequence is one such protein variant. In the present invention the heat-labile enterotoxin (LT) of Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel exotoxin protein variant useful as protein carrier for facilitating gene delivery, comprises a mucosal cell binding motif of an exotoxin and a nucleic acid affinity domain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to recombinant exotoxin protein variants, which comprise an exotoxin mucosal cell binding motif and a nucleic acid affainty domain. The present sequence is one such protein variant. In the present invention the heat-labile enterotoxin (LT) of Escherichia coli was used as an exotoxin. LT is a member of the ADP-ribosylating exotoxin (bARE) family. The protein variants are useful for selectively delivering nucleic acid concodes an antigen to which the immune response when the for selectively delivering a gene to a mucosal cell, and for achieving expression of a protein in a subject, by administering a composition comprising the protein variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel exotoxin protein variant useful as protein carrier for facilitating gene delivery, comprises a mucosal cell binding motif of an exotoxin and a nucleic acid affinity domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The fusion protein is antigenic and is useful for decreasing colonisation in chickens by Campylobacter species. The labile toxin B-subunit component of the fusion protein (i) binds to ganglioside GMI component to the mucosal surface, resulting in an immune response against campylobacter jejuni reducing colonization by the organism; and (ii) has an adjuvant effect on immunoglobulin A secretion. The fusion protein expressed by the recombinant gene is relatively simple to produce and purify, can be produced in large quantities and can be used for vaccination without any further treatment other than purification.
was used as an exotoxin. LT is a member of the ADP-ribosylating exotoxin (bARE) family. The protein variants are useful for selectively delivering nucleic acid to mucosal cells, for inducing an immune response when the nucleic acid encodes an antigen to which the immune response is desired, for selectively delivering a gene to a mucosal cell, and for achieving expression of a protein in a subject, by administering a composition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fusion protein; labile toxin B subunit; LT-B; E. coli; flagellin; flaA; C. jejuni; antigenic; colonisation; chicken; Campylobacter; vaccine; immune response; ganglioside GM1; immunoglobulin A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a recombinant fusion protein consisting of the Campylobacter jejuni flagellin protein (flaA) fused to the Escherichia coli B subunit of the labile toxin (LT-B). The fusion protein is antigenic and when administered in vaccines decreases colonisation of chickens by Campylobacter species. The LT-B component serves to deliver the flagellin antigen to mucosal surfaces and also has an adjuvant effect

    The invention relates to peptide fragments of the Escherichia coli heat labile enterotoxin (Etx) and its closely related homologue, cholera coxin (Citx) from Vibrio cholerae which do not bind to the ubiquitous GM-1 ganglioside receptors on host cell surfaces. Both Etx and ctx and ctx and composed of one A subunit and five identical B subunits. The A subunit composed of one A subunit while the B subunits. The A subunit cross-linking of GM-1 receptors. Although GM-1 binding and cross-linking of GM-1 receptors. Although GM-1 binding is responsible for some of the effects of Etx and ctx, it has been found that certain effects of the toxins, such as immunomodulation, are not mediated control of GM-1 properties of the invention are fragments of the beta-4 - alpha-2 loop of EtxB and/or CtxB, exerting the same effects as normal EtxB and ctxB subunits, except that they do not bind or cross link GM-1. They may be used as an inhibitor for toxin-induced diarrhoea. Therefore, the peptides may be used in the production of a composition for treating, preventing and/or modulating a disease associated with an immune disorder and/or toxin-induced diarrhoea. Sequences AAY87460 being repersent preferred.
                                                                                                                            Cholera toxin subunit B; CtxB; heat labile enterotoxin subunit B; EtxB; beta-4-alpha-2 loop; GM-1 ganglioside receptor; immunomodulation; adjuvant; immune disorder; diarrhoea.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Derivatives of Escherichia coli heat labile enterotoxins useful as immunomodulators and for treating diarrhea and which do not bind the glycolipid receptor \mathsf{GM-1} .
                                                                                 Cholera toxin B/enterotoxin B-derived peptide, SEQ ID NO:4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Length 21;

ö
Recombinant constructs comprising a promoter functional in Bordetella leader sequence for a heterologous gene or a non-construct la leader sequence for secretion of a gene product which may or may not be of Bordetella, immunogens, allergens, enzymes or may not be of Bordetella, immunogens, allergens, enzyme in Bordetella of enzymes, antigens, immunoglobulins or their fragments, toxins, mammalian proteins, structural proteins or receptors. The Bordetella strains are particularly engineered to express the cholera toxin B subunit (this sequence). The promoters used in the constructs are selected from the Bordetella pertussis tox, fha promoters or the high molecular weight (hmw) outer membrane promoter of non typable Haemophilus influenzae; leaders used in the constructs are selected from the cholera toxin B leader (CTB-L), the pertussis toxin subunit s1 leader (S1-L) and the pertussin pertactin leader (PRN-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the constructs are selected from a leader (CTB-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the constructs are selected from a leader (PRN-L); and genes used in the leader (PRN-L); and genes used in the constructs are selected from a

                                                                                                                                                                                                                                                                                                                                                                                                                                              ÷
                                                                                                                                                                                                                                                                  A transgenic plant comprising or expressing a DNA sequence encoding an immunogenic agent can be be used as an oral vaccine for animals. The vaccine is administered by the oral consumption of the plant and provides the first known functional method for immunising animals using transgenic plants, where the plants express bacterial antigens that act as both immunogens and adjuvants. The method provides an inexpensive production and delivery system for such antigens to animals. This is the LT-B Escherichia coli toxin subunit and its coding sequence was used in the construction of such a transgenic plant. The immunogenic agent preferably comprises the LT-B or CT-B (cholera toxin B.subunit) or optionally LT-A or CT-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

```
AAW06606 is a mature cholera toxin B subunit (CTB)/heat labile enterotoxin B subunit (LTB) hybrid molecule. In mature CTB protein, certain amino acids (aa) were replaced with corresponding aa from heat-labile enterotoxin B subunit (LTB). The specific amino acid substitutions impart LTB-specific epitope characteristics to immunogenic mature CTB. The hybrid molecules have increased cross-reactivity and are suitable for a broad spectrum vaccine to protect against enterotoxigenic illness. Immunogenic proteins comprising the hybrid molecules can be used to treat, or in a vaccine to prevent, enterotoxin-induced illness, e.g. diarrhoea a vaccine to prevent, enterotoxin-induced illness, e.g. diarrhoea cand vomiting, in humans and animals.

Note - This sequence does not appear in the specification, it is a claimed mutant sequence of mature cholera toxin B subunit (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Heat labile; tolerant; stable; hybrid; cholera toxin B subunit; CTB; heat labile enterotoxin B subunit; LTB; vaccine; immunisation; immunogen; antigen; broad spectrum; cross reactive; diarrhoea; vomiting; food poisoning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cholera toxin B subunit/heat labile enterotoxin B subunit hybrid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sub-unit

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                         AAW06607 is a mature cholera toxin B subunit (CTB)/heat labile enterotoxin B subunit (LTB) hybrid molecule. In mature CTB protein, certain amino acids (aa) were replaced with corresponding as from heat-labile enterotoxin B subunit (LTB). The specific amino acid substitutions impart LTB-specific epitope characteristics to immunogenic mature CTB. The hybrid molecules have increased cross-reactivity and are suitable for a broad spectrum vaccine to protect against enterotoxigenic lilness. Immunogenic proteins comprising the hybrid molecules can be used to treat, or in a vaccine to prevent, enterotoxin-induced illness, e.g. diarrhoea
                                                                                                                                                                                                                                                                                                                                                                                                               and vomiting, in humans and animals.

Note - This sequence does not appear in the specification, it is a claimed mutant sequence of mature cholera toxin B subunit (see
                                                                                                                                                                                                                                               Heat-labile enterotoxin B sub-unit and cholera toxin B sub-unit hybrid protein - opt. fused to immunogenic sequence for use in vaccines against enterotoxin-induced illness

cholera toxin B-subunit; hybrid protein; heterologous IgA active antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the amino acid sequence of the cholera toxin B subunit used in the method of the invention involving the use of nontoxic subunits as an effective adjuvant in coadministration of an antignen to birds and animals. In addition to the use of the toxin as an mucosal adjuvant, it also provides a vaccine comprising the toxin, an immunogenic amount of an antigen, and a pharmaceutically acceptable carrier. The toxin can be used with single/multiple vaccines, and it enables the possibility for commercial mucosal adjuvants for use in humans, since these are more effective and safer than vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                             New mutant cholera toxin selected from a group comprising nontoxic subunits/derivatives - effective as an adjuvant when coadministered with an antigen to birds and mammals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

In the patent, the DNA encoding LT-B is expressed as part of a fusion protein with an epitope of a malaria parasite, eg Region I or Region II or repeat region of circumsporozoite protein antigen (CS) (AAP93560) from Plasmodium berghei. Pref. the fusion gene is inserted into attenuated Salmonella enteriditis under the left promoter control of lambda. Such bacteria can multiply in the host without causing disease or disorder and express CS that will induce a protective immune response against malaria and can be used in vaccines. Such vaccines can be multivalent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Cholera toxin B subunit, used for hybrid immunogenic toxin production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW06605 is the full (including the signal peptide) length cholera toxin B subunit (CTB), this sequence is described as unpublished in the specification. The mature CTB protein was used to create hybrid mutants, in which certain amino acids (aa) of CTB were replaced with corresponding as from heat-labile enterotoxin B subunit (LTB), see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Heat labile; tolerant; stable; hybrid; cholera toxin B subunit; heat labile enterotoxin B subunit; LTB; vaccine; immunisation; immunogen; antigen; broad spectrum; cross reactive; diarrhoea; vomiting; food poisoning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Heat-labile enterotoxin B sub-unit and cholera toxin B sub-unit hybrid protein - opt. fused to immunogenic sequence for use in vaccines against enterotoxin-induced illness
                                                                                                                                                                                                                                                               Length 124;

                                                                                                                                                                                                                                                                                                                                                                                                       ö
AAW06606 and AAW06607. The specific amino acid substitutions impart LTB-specific epitope characteristics to immunogenic mature CTB. The hybrid molecules have increased cross-reactivity and are suitable for a broad spectrum vaccine to protect against enterotoxigenic illness. Immunogenic proteins comprising the hybrid molecules can be used to treat, or in a vaccine to prevent, enterotoxin-induced illness, e.g. diarrhoea and vomiting, in humans and animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the amino acid sequence of Escherichia coli beta-subunit of heat labile enteritoxin (LTB). It is used in the method of the invention to create fusion proteins which are useful as vaccinating immunogens. The fusion proteins are useful in vaccines, specifically where the antigenic peptide is an inhibin fragment for increasing the fertility of an animal (by increasing levels of follicle stimulating hormone (FSH) or production of sperm or ova), but more generally for inducing an immune response against the antigenic peptide. Vaccines are particularly administered orally, e.g. fusion protein is expressed in edible plants or animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Beta-subunit of heat labile enterotoxin; LTB; fusion protein; vaccine; immunogen; antigen; inhibin; fertility; follicle stimulating hormone;

This synthetic Escherichia coli heat-labile toxin (LT) B subunit (LT-B) is encoded by a plant-codon optimized cDNA. The cDNA sequence contains plant-preferred codons and eliminates sequence motifs associated with spurious mRNA processing. The second codon is changed from AAT encoding year to GTG encoding Val, in order to create a Ncol restriction site at the 5' end. Novel polynucleotides encode a mutant LT-A polypeptide or a mutant Vibrio cholerae cholera toxin (CT) A subunit (CT-A) polypeptide, which have reduced enzyme activity as compared to the wild-type LT-A or CT-A polypeptide and where at least one of the codons is altered to a plant preferred codon. The polynucleotide further comprises a nucleic acid sequence encoding LT B subunit (LT-B) or a CT B subunit (CT-B). The polynucleotides are useful for the transformation of plant cells for the polynucleotides are useful for the transformation of plant cells for the prophylactic or therapeutic treatment against E. coli or V. cholerae. The mutant polypeptides are

This allows the use of a strategically placed EcoRI site just upstream
        of the RBS on the LTB gene for the insertion of a strong tac promoter for the expression of CTB. The protein can be used as Vaccines, diagnostic reagents and receptor-blocking agents for prophylaxis of cholera and E.coli diarrhoea.

However, there are a tremendous number of M protein serotypes. The invention provides recombinant M protein antigens comprising a gene encoding a carrier protein and an NH2 or COOH terminal M protein fragment carrying one or more epitopes. The carrier may be the B subunit of E.coli labile toxin (LT-B). The carrier and the antigen may be linked by a linker, eg AAR50226. The LT-B-M24 fusion gene of the example was expressed using E.coli. The M24 component constists of a pair of synthetic oligos which copied the first 36 bp of the emm 24 gene. Rabbits immunised with the LT-B-M24 developed type-specific bacteriocidal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New recombinant hybrid streptococcal M protein antigen(s) - which elicit opsonic antibodies without eliciting cross-reactive antibodies to mammalian heart tissue

Derivatives of Escherichia coli heat labile enterotoxins useful as immunomodulators and for treating diarrhea and which do not bind the glycolipid receptor GM-1

The invention relates to peptide fragments of the Escherichia coli heat labile enterotoxin (Etx) and its closely related homologue, cholers toxin (Ctx) from vibil cholerae which do not bind to the ubiquitous CM-1 ganglioside receptors on host cell surfaces. Both Etx and ctx are composed of one A subunit and five identical B subunits. The A subunit is responsible for toxicity, while the B subunits (EtxB and CtxB) ribosyltransferase activity, while the B subunits (EtxB and CtxB) across-linking of GM-1 receptors. Although GM-1 binding is responsible. Cor some of the effects of Etx and Ctx, it has been found that certain effects of the toxins, such as immunomodulation, are not mediated through GM-1 binding; The peptides of the invention are fragments of the beta-4- alpha-2 loop of EtxB and CtxB, exerting the same effects as normal EtxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an immunomodulator or adjuvant. They may also be used as an inhibitor for toxin-induced diarrhoea. Therefore, the peptides may be used in the production of a composition of a composition for treating, preventing and/or modulating a disease associated with an immune disorder and/or toxin-induced disarnhoea. Example 5; Page 45; 62pp; English.

The invention relates to peptide fragments of the Escherichia coli heat labile enterotoxin (Etx) and its closely related homologue, cholera coxin (Ctx) from Vibrio cholerae which do not bind to the ubiquitous CG M-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit ciposyltransferase activity, while the B subunits (EtxB and CtxB) ADP-cribosyltransferase activity, while the bost cell via the binding and cross-linking of GM-1 receptors. Although GM-1 binding is responsible CC cross-linking of GM-1 receptors. Although GM-1 binding is responsible corps-linking of GM-1 receptors. Although GM-1 binding is responsible corps-linking of GM-1 as immunomodulation, are not mediated through GM-1 binding. The peptides of the invention (AAVG7461-Y87463) are crasments of the beta-4-alpha-2 loop of EtxB and/or CtxB, exerting the same effects as normal ExxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an inhibitor for immunomodulator or adjuvant. They may also be used as an inhibitor for toxin-induced diarrhoea. Therefore, the peptides may be used in the composition for treating, preventing and/or modulating a corresponding to a portion of the beta-4-alpha-2 loop of EtxB and CtxB corresponding to a portion of the beta-4-alpha-2 loop of EtxB and CtxB corresponding to a portion of the beta-4-alpha-2 loop of EtxB and CtxB carnes immunomodulatory effects. Peptide AAVG7464 corresponds to residues corresponding to a portion of the beta-4-alpha-2 loop of EtxB and CtxB carnesponding to a portion of the beta-4-alpha-2 loop of EtxB and CtxB candomly selected control peptide.

                                                                                                                                                                                                                                                         g
                                          The invention relates to peptide fragments of the Escherichia coli heat labile enterotoxin (Etx) and its closely related homologue, cholera toxin (Ctx) from Vibrio cholerae which do not bind to the ubjusticous GM-1 ganglioside receptors on host cell surfaces. Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-ribosyltransferase activity, while the B subunits (EtxB and CtxB).

Thosyltransferase activity, while the B subunits (EtxB and CtxB) accilitate the entry of subunit A into the host cell via the binding and cross-linking of GM-1 receptors. Although GM-1 binding is responsible for some of the effects of Etx and Ctx, it has been found that certain through GM-1 binding is responsible.

Through GM-1 binding The peptides of the invention are fragments of the chrough GM-1 binding The peptides of the invention are fragments of the beta-4 alpha-2 loop of EtxB and/or CtxB. exerting the same effects as normal EtxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used in medicine as an immunomodulator or adjuvant. They may also be used as an inhibitor for toxin-induced diarrhoea. Therefore, the peptides may be used in the production of a composition immune disorder and/or toxin-induced diarrhoea. Sequences AAY87460-Y87463 represent preferred peptides of the invention, AAX87460 being
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New recombinant flagellin gene including sequence - for heterologous epitope, and expressed fusion proteins, useful in vaccines and for prodn. of antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                epitope of Cholera toxin B subunit; flagellin fusion protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
subunit. The DNA sequence encoding this ligates to othersynthetic oligonucleotides to form a new recombinant gene. This encodes a flagellin fusion protein which can be used in vaccines for immuno-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A compsn. comprising a conjugate of an antigenic cholera B toxin peptide fragment (e.g. AAR85126-30 and esp. AAR85125), covalently bound to a microparticulate inert carrier (e.g. modified silica or thyroglobulin) can be used as an oral vaccine for immunisation against cholera infection. The inert carrier is insoluble in the digestive tract, allowing presentation of the antigen in the intestines, where it will elicit antibodles mainly of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vaccines for oral immunisation against infecting agents, e.g. cholera - comprise a conjugate of an antigen of an infecting agent covalently bound to micro:particulate inert carrier, e.g. modified

```
The invention relates to peptide fragments of the Escherichia coli heat labile enterotoxin (Etx) and its closely related homologue, cholera conflicts from Vibrio cholerae which do not bind to the ubdiquitous GM-1 gangiloside receptors on host cell surfaces. Both Etx and Ctx are composed of one A subunit and five identical B subunits. The A subunit is responsible for toxicity, while the B subunits (EtxB and CtxB) ribosyltransferase activity, while the B subunits (EtxB and CtxB) facilitate the entry of subunit A into the host cell via the binding and cross-linking of GM-1 receptors. Although GM-1 binding is responsible for some of the effects of Etx and Ctx, it has been found that certain effects of the toxins, such as immunomodulation, are not mediated through GM-1 binding. The peptides of the invention are fragments of the beta-4 alpha-2 loop of EtxB and/or CtxB, exerting the same effects as normal EtxB and ctxB subunits, except that they do not bind or cross link GM-1 They may be used in medicine as an immunomodulator or adjuvant. They may also be used as an inhibitor for toxin-induced diarrhoea. Therefore, the peptides may be used in the production of a composition of contrating, preventing and/or modulating a disease associated with an immunomedisorder and/or toxin-induced diarrhoea. Sequences AAR87460-Y87463 represent preferred.

```
The invention relates to peptide fragments of the Escherichia coll heat labile enterotoxin (Etx) and its closely related homologue, cholera to total from vibrio cholerae which do not bind to the ubdiguitous composed of nom A subunit and five identical B subunits. The A subunit is responsible for toxicity, possessing adenosine diphosphate (ADP) ADP-ribosyltransferase activity, while the B subunits (EtxB and CtxB) actilitate the entry of subunit A into the host cell via the binding and cross-linking of GM-1 receptors. Although GM-1 binding is responsible for some of the effects of Etx and Ctx. it has been found that certain effects of the toxins, such as immunomodulation, are not mediated for some of the toxins, such as immunomodulation, are not mediated beta-4- alpha-2 loop of EtxB and/or CtxB. exerting the same effects as normal EtxB and CtxB subunits, except that they do not bind or cross link GM-1. They may be used as an immunomodulator or adjuvant. They may also be used as an inhibitor for toxin-induced diarrhoea Therefore, the peptides may be used in the production of a composition of the creating repersent preferred peptides of the invention. AAY87460 being repersent preferred.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence is encoded by a fragment of the the plasmid pLPA93
which was used in the production of fimH fusion genes comprising
the cholera toxin B subunit inserted into the fimH gene. This insert
shows the inclusion of the B subunit into the FimH protein at position
224-226. The chimeric genes were then opt. further modified by insertion
of the hepatitis B virus surface antigen pre-$2 region into a different
position of the FimH adhesin of type I fimbriae. Restriction site handles
(BGIII sites) were introduced into the fimH gene, and the foreign
con insertion of the epitopes did not significantly alter the adhesive
function of the pinches ind not significantly alter the adhesive
con the surface of fimbriae on bacterial hosts illustrated the possibility
con the surface of fimbriae on bacterial presenters of foreign antigens and
continued by the spitopes are as general presenters of foreign antigens and
continued by the spitopes are all the production of variant
continued by the spitopes of the compounds and military of the compounds
continued by the spitopes are all the production of variant
continued by the spitopes are all the production of variant
continued by the spitopes are all the compounds
continued by the spitopes are all the spitopes and miscrobial cells to locations comprising selected receptors to which

```

```
The inventors claim cholera toxin B1 subunit sequences which carry Arg in posn. 35, 67 or 73 (AAP30264, AAP30265, AAP30600). Tests have shown that Arg in posns. 35, 67 and 73 play an important role in fixing these toxins to cell walls. The peptides are used in the treatment of, and vaccination against, cholera infections and animal and human infections due to E. coll (enterotoxin IT). The medicament may be administered by oral, intraperitoneal, sub-cutaneous or intravenous routes. For vaccines, pref. peptides having 15-30 AAs are injected without carriers. Unit dose when used as a medicament is 50-500mg as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Network polymer which comprises a series of composite E. coli heat-labile toxin (LT)/heat-stable toxin (ST) polypeptide repeating untis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                    Sequence of amino acids 50-75 of the cholera toxin B1 subunit which carries an Arg at posns. 67 and 73.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cholera toxin B, sub-unit polypeptide(s) as vaccines and medicaments - effective against Escherichia coli and Vibrio cholerae infections, are prepd. by solid phase peptide synthesis

                                                                                                                                                                                                                       The repeating units are bonded together by intramolecular interpolypeptide cystine bonds formed between oxidized Cys residues of the repeating units. This polypeptide may be used in the vaccination of mammals for protection against the enterotoxins. The composite polypeptide is made by solid phase synthesis or recombinant DNA techniques. X9 is Met or Lys. X12 is Ala or Glu, X39 is Asn or Tyr and X46 is Tyr or Asn. See also AAP50439-57.

The inventors claim cholera toxin Bi subunit sequences which carry Arg in posn. 35, 67 or 73 (AAP30264, AAP30265, AAP30600). Tests have shown that Arg in posns. 35, 67 and 73 play an important role in fixing these toxins to cell walls. The peptides are used in the treatment of, and vaccination against, cholera infections and animal and human infections due to E. coli (enterotoxin LT). The medicament may be administered by oral, intraperitoneal, sub-cutaneous or intravenous routes. For vaccines, pref. peptides having 15-30 AAs are injected without carriers. Unit dose when used as a medicament is 50-500mg as a vaccine 1-10mg of active cpd.
                                                                             The repeating units are bonded together by intramolecular interpolypeptide cystine bonds formed between oxidized cys residues of the repeating units. This polypeptide may be used in the vaccination of mammals for protection against the enterotoxins. The composite polypeptide is made by solid phase synthesis or recombinant DNA techniques. X9 is Met or Lys, X12 is Ala or Glu, X39 is Asn or Tyr and X46 is Tyr or Asn. See also AAP50439-57.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence of amino acids 350-75 of the cholera toxin B1 subunit which carries an Arg at posns. 35, 67 and 73.

Involving analysis of the 3-dimensional form of the crystalline involving analysis of the 3-dimensional form of the crystalline holotoxin. The pertursis holotoxin modification process comprises:

(1) identification of at least one amino acid (aa) residue of the holotoxin for modification by analysing the 3-dimensional form of the crystalline holotoxin, in relation to known information of the protein structure and function; (2) effecting mutagenesis (by removing or replacing a nucleotide sequence encoding at least one (aa)) of a tox operon; and (3) expressing mutant tox box in a Bordetella organism to produce the modified holotoxin. This method is used for modifying pertussis holotoxin, by studying its 3-dimensional crystalline structure. Modifying the holotoxin, alters its blological properties. By analysing the 3-dimensional crystalline structures of the pertussis holotoxin can be identified. This can be used to predict (aa) which affect blological properties of the pertussis holotoxin can be identified. This can be used to predict (aa) which affect blological properties of the pertussis holotoxin. The present sequence represents an ADP-ribosylating toxin and a problem of the pertussis holotoxin. The present sequence represents an ADP-ribosylating toxin and a problem.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAR72540-R72545 are structurally equivalent B-subunits from three ADP-ribosylating toxins, pertussis holotoxtin (PT), E. coli heat labile toxin (LT), and verotoxin-1 (VT). The structural information obtd. from these comparisons was used to identify sites which contribute to PT's blological activity. By modifying these sites the claimed PT mutants of the invention were produced, they can be used in the development of vaccines against Bordetella

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 1
   NAME OF THE PROOF 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to methods of preparing a pertussis holotoxin (PT) having a modified biological activity. One method comprises identifying at least 1 site in a PT that interacts with a molecule that is capable of forming a complex with the holotoxin and which molecule is an effector molecule which is an adenine nucleotide and which site contributes to toxicity, cell binding or enzymatic activity of PT. The functional contracting site(s) are identified by analysing the three dimensional structure of crystalline PT, determined by X-ray crystallogaphy. The identified interacting site(s) are modified to alter toxicity, cell structure of crystalline PT, determined by X-ray crystallogaphy. The identified interacting site(s) are modified to alter toxicity, cell binding or enzyme activity of the PT. The methods can be used to alter a biological activity such as toxicity, enzymatic activity, mitogenicity, cell binding and adjuvanticity of the PT. The three-dimensional structure of proper activity of the PT. The three-dimensional structure cof PT have functional and/or structural resemblance to other bacterial toxins such as diphtheria toxin (DT), Pseudomonas exotoxin A (ETA), the heat-labile toxin of E. Goli (LT) and verotoxin-1 (VT). The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Modifications to e.g. enzymatic activity, mitogenicity and cell binding of pertussin holotoxin - by identifying interaction sites of a molecule with crystalline toxin and modifying the identified site

The present invention describes a crystalline form of isolated pertussis holotoxin, in which the molecules of pertussis toxin have pertussis holotoxin, in which the molecules of pertussis toxin have complexed with a polysaccharde molecule capable of forming a comparable with the holotoxin. The crystalline form of the pertussis holotoxin can be used in a comparison with other proteins which have functional resemblance to pertussis holotoxin with the aim of modifying other proteins. Identifying the unknown sites of toxicity by comparison with the three dimensional structure of pertussis holotoxin provides a technique for detoxification of toxins to produce useful immunogenic but non-toxic analogues. It can also be used as a primary standard to measure the quantity, purity or efficacy of less pure compositions containing pertussis toxin. AAY68340 to AAX68385 represent peptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pertussis toxin; crystal structure; whooping cough; biological activity; lymphocytosis-promoting factor; histamine-sensitising factor; islet-activating protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides a method for producing a pertussis toxin (also designated lymphocytosis-promoting factor, histamine-sensitising factor and islet activating protein) with a modified biological activity, involving analysing the crystal structure of the protein to identify active sites which can then be modified. This may lead to an alteration in the toxicity, cell binding or enzyme activity of the toxin. This can be used in the production of immunoprotective analogues of pertussis toxin is the cause of whooping cough following infection by Bordetella pertussis.
                                                                                                                                                                                                                                                                                                       Modifying pertussis holotoxin to produce detoxified PT analogs, comprising analyzing crystalline structure of toxin, to identify sites of toxicity, cell binding or enzyme activity of PT and modifying

```
Bordetella leader sequence for secretion of a gene product which may cor may not be of Bordetella origin, can be used for the expression in Dordetella of Enzymes, antigens, immunogens, allergens, enzyme inhibitors, hormones, immunoglobulins or their fragments, toxins, mammalian proteins, structural proteins or their receptors. The Bordetella strains are particularly engineered to express the cholera toxin B subunit (this sequence). The promoters used in the constructs are selected from the Bordetella pertussis tox, that promoters or the high molecular weight (hmw) outer membrane promoter of non typable Haemophilus influenzae; leaders used in the constructs are selected from the cholera toxin B leader (CTB-L), the pertussis toxin subunit 31 leader (S1-L) and the pertussin pertactin leader (PRN-L); and genes used in the constructs are selected from a constructs are selected from a convel synthetic cholera toxin B gene (ctb) and the hmwl and hmw2
                                                                                                                                                                                                                                                                                                                                                                                                                         genes of Haemophilus influenzae

sgenic plants contg. E. coli heat labile enterotoxin subunits as oral vaccines for animals which consume the plant

an immunogenic agent can be be used as an oral vaccine for animals. The vaccine is administered by the oral consumption of the plant and provides the first known functional method for immunising animals using transgenic plants, where the plants express bacterial antigens that act as both immunogens and adjuvants. The method provides an inexpensive production and delivery system for such antigens to animals. This is the LT-B Escherichia coli toxin subunit and its coding sequence was used in the construction of such a transgenic A transgenic plant comprising or expressing a DNA sequence encoding

Gaps Heat labile; tolerant; stable; hybrid; cholera toxin B subunit; CTB; heat labile enterotoxin B subunit; LTB; vaccine; immunisation; immunogen; antigen; broad spectrum; cross reactive; diarrhoea; AAW06606 is a mature cholera toxin B subunit (CTB)/heat labile enterctoxin B subunit (LTB) hybrid molecule. In mature CTB protein, certain amino acids (aa) were replaced with corresponding as from heat-labile enterotoxin B subunit (LTB). The specific amino acid substitutions impart LTB-specific epitope characteristics to immunogenic mature CTB. The hybrid molecules have increased cross-reactivity and are suitable for a broad spectrum vaccine to Cholera toxin B subunit/heat labile enterotoxin B subunit hybrid. Heat-labile enterotoxin B sub-unit and cholera toxin B sub-unit hybrid protein - opt. fused to immunogenic sequence for use in vaccines against enterotoxin-induced illness ö Length 103; Indels /label= substitution /note= "wild-type His replaced by Asn" Misc-difference 95 /label= substitution /note= "wild-type Thr replaced by Ala" /label= substitution /note= "wild-type Ala replaced by Ser" ö 100.0%; Score 39; DB 17; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW06607 is a mature cholera toxin B subunit (CTB)/heat labile enterotoxin B subunit (LTB) hybrid molecule. In mature CTB protein, certain amino acids (aa) were replaced with corresponding aa from heat-labile enterotoxin B subunit (LTB). The specific amino acid substitutions impart LTB-specific epitope characteristics to
protect against enterotoxigenic illness. Immunogenic proteins comprising the hybrid molecules can be used to treat, or in a vocine to prevent, enterotoxin-induced illness, e.g. diarrhoea and vomiting, in humans and animals.

Note - This sequence does not appear in the specification, it is a claimed mutant sequence of mature cholera toxin B subunit (see
                                                                                                                                                                                                                                                                                                                                                                                                     Cholera toxin B subunit/heat labile enterotoxin B subunit hybrid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Misc-difference 1..25

```
This is the amino acid sequence of the cholera toxin B subunit used in the method of the invention involving the use of nontoxic subunits as an effective adjuvant in coadministration of an antigen to birds and animals. In addition to the use of the toxin as an mucosal adjuvant, it also provides a vaccine comprising the toxin, an immunogenic amount of an antigen, and a pharmaceutically acceptable carrier. The toxin can be used with single/multiple vaccines, and it enables the possibility for commercial mucosal adjuvants for use in humans, since these are more effective and safer than vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cholera toxin B subunit; nontoxic subunit; adjuvant; coadministration;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New mutant cholera toxin selected from a group comprising nontoxic subunits/derivatives - effective as an adjuvant when coadministered
immunogenic mature CTB. The hybrid molecules have increased cross-reactivity and are suitable for a broad spectrum vaccine to protect against enterotoxigenic illness. Immunogenic proteins comprising the hybrid molecules can be used to treat, or in a vaccine to prevent, enterotoxin-induced illness, e.g. diarrhoea and vomiting, in humans and animals.

Note - This sequence does not appear in the specification, it is a claimed mutant sequence of mature cholera toxin B subunit (see
                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

In the patent, the DNA encoding LT-B is expressed as part of a fusion protein with an epitope of a malaria parasite, eg Region I or Region II or a repeat region of circumsporozoite protein antigen (CS) (AAP93560) from Plasmodium berghei. Pref. the fusion gene is inserted into attenuated Salmonelia enteriditis under the left promoter control of ambda. Such bacteria can multiply in the host without causing disease or disorder and express CS that will induce a protective immune response against malaria and can be used in vaccines. Such vaccines can be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 21, A

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Whaterin 20-oxidase - common tobacco

Whaternate names: Nto16 protein

Cispecies: Nicotiana tabacum (common tobacco)

Cispecies: Nicotiana (missecon tobacco)
